84 Park Avenue, Eastchester, NY

SUMMARY

I am a Seasoned software engineer and systems architect with extensive experience designing, modernizing, and supporting mission-critical platforms within global financial institutions and enterprise technology environments. I am known for building resilient infrastructure, optimizing data pipelines, and developing scalable automation frameworks that improve system reliability, operational efficiency, and deployment workflows. Also a plus is my ability to combine strong programming expertise with architectural insight, enabling the design of tools and frameworks that streamline development operations, strengthen system governance, and support evolving business requirements in highly regulated and data-intensive industries.

SKILLS

- Leadership
- Problem-solving
- Security & System Governance
- Linux & UNIX system environments
- Collaboration
- Strategic Thinking
- Asset Management
- DevOps & Automation
- Multi-language Programming
- Data Engineering & Database Technologies

EXPERIENCE

07/2015- 08/2025

Senior Software Engineer, Bloomberg

- Led the restructuring and modularization of an internal software distribution platform, transforming previously monolithic scripts into maintainable and testable components to improve reliability and scalability of the packaging system.
- Developed integration mechanisms that enabled interoperability between Perl and Python modules, allowing gradual migration of legacy components while maintaining system stability.
- Designed and implemented dynamic module-loading mechanisms that allowed runtime switching between alternative implementations, significantly improving flexibility during system upgrades and troubleshooting.
- Built reusable modules to standardize subprocess execution, monitoring, and logging, ensuring reliable orchestration of system-level operations and preventing process failures or stalls.
- Created abstraction layers for internal communication protocols, simplifying message exchange and connection management between distributed applications.

07/2013- 06/2015

President, Oreste Software, Inc.

- Founded and managed a consulting company providing specialized software development and infrastructure engineering services to financial institutions.
- Led client engagements focused on enterprise platform upgrades, automation initiatives, and system infrastructure improvements within complex technology environments.
- Designed and implemented large-scale job scheduling and workload automation solutions, supporting enterprise-wide migration from legacy scheduling platforms to modern automation systems.
- Architected disaster recovery and high-availability environments to strengthen operational resilience and ensure continuity of critical financial systems.
- Developed custom automation utilities to streamline the transition between scheduling platforms, enabling gradual migration while minimizing disruption to production operations.

08/2012- 06/2013

Vice President – Electronic Trading Data Group, Knight Capital Americas, LLC

- Contributed to the development of enterprise data infrastructure designed to consolidate multiple data acquisition and processing systems used across the electronic trading environment.
- Designed and implemented components of a securities reference data management system to replace legacy data-loading processes and improve reliability of market data ingestion.
- Developed a manual data resolution interface that enabled users to review and correct conflicting or inconsistent reference data identified during system processing.
- Built logic to detect discrepancies across incoming data sources by extracting and translating validation rules from existing legacy processes into the new system.
- Supported the design and maintenance of database object release and deployment processes to ensure controlled updates within Oracle database environments.

02/2010- 08/2012

Vice President – Core Strategies Group, Goldman Sachs

- Provided development and technical support to quantitative strategists within the Securities Division by building and maintaining tools used for large-scale financial data analysis and processing.
- Designed and implemented data ingestion pipelines to load and maintain institutional financial datasets, including automated delta updates and periodic full database refreshes to ensure data accuracy.
- Developed and enhanced enterprise ETL frameworks used to parse, transform, and load high-volume datasets into database environments supporting analytics and research activities.
- Developed log processing tools that extracted, formatted, and organized system activity data for downstream analysis and data mining initiatives.
- Refactored legacy data processing scripts into modular components to support parallel data loading across multiple database environments.

08/2008- 01/2010

Senior Programming Consultant, VP, State Street Investment Management Services

- Supported legacy investment management systems while participating in the migration of data and operational processes to State Street's enterprise technology platforms.
- Contributed to the development and enhancement of a centralized data warehouse that consolidated internal and external financial data during a phased transition between systems.
- Designed and implemented data processing frameworks that generated periodic investment performance calculations using daily data feeds while accounting for complex portfolio activity.
- Assisted in restructuring the warehouse architecture to support a staged system migration, enabling legacy and new platforms to operate simultaneously during the transition period.
- Assisted in restructuring the warehouse architecture to support a staged system migration, enabling legacy and new platforms to operate simultaneously during the transition period.

05/1998- 08/2008

Vice President, Information Technology, Lazard Asset Management

- Served as a senior technical resource responsible for the design, development, and support of core investment management and reporting systems used across the organization.
- Acted as the primary database performance specialist, working with database administrators and development teams to diagnose performance bottlenecks, optimize queries, and improve overall database efficiency.
- Established standardized development environments, project structures, and file management frameworks to improve developer productivity and reduce configuration inconsistencies across projects.
- Designed and maintained reusable software modules that standardized system functions such as process execution, error handling, and integration with external platforms.
- Led the migration and upgrade of enterprise development environments, coordinating testing and deployment of new software versions across multiple systems and applications.

08/1993- 05/1998

Project Manager, Clearing and Settlement Systems, Instinet

- Led development and enhancement of clearing and settlement systems responsible for processing trade transactions and generating financial accounting records.
- Designed and implemented structured code repository frameworks and release management procedures to improve version control and software deployment processes.

- Developed reusable programming libraries and utilities that standardized common development tasks such as messaging, database connectivity, and network communication.
- Built tools to support parameterized database script execution, enabling more efficient system installation and configuration across multiple environments.
- Managed development initiatives that introduced new trading and settlement functionalities required to support expanding global market operations.

05/1992- 08/1993

Senior Analyst, Debt Markets Group, Merrill Lynch, Pierce, Fenner and Smith

- Developed and enhanced software tools used within the debt markets environment to support analysis, reporting, and processing of mortgage and fixed-income securities data.
- Integrated software development tools with enterprise development environments to improve build automation and streamline version control processes for engineering teams.
- Designed and implemented programming frameworks that supported specialized financial modeling and data manipulation requirements within mortgage-backed securities systems.
- Modernized reporting and batch-processing applications by migrating systems between hardware platforms while maintaining operational continuity.
- Created reusable software components that improved consistency and efficiency in the development of financial analytics and reporting applications.

08/1989- 05/1992

Applications Programmer, Fixed Income Analytics, Bear Stearns, Inc.

- Developed software applications and utilities that supported analytical systems used to monitor and evaluate fixed-income securities including mortgage-backed, treasury, and corporate instruments.
- Built data input and output tools that enabled consistent file creation and data exchange across different computing environments.
- Designed and implemented developer utilities that standardized user interface components and system messaging functions used across internal applications.
- Enhanced analytical tools used by financial professionals by improving data presentation and user interaction within fixed-income tracking systems.
- Developed database-driven applications used to manage and monitor mortgage-backed securities programs and related financial instruments.

06/1987- 08/1989

Systems Officer, Institutional Bank, Citicorp

- Developed enterprise software utilities that integrated code management tools, database systems, and system installation utilities to support application development and deployment processes.
- Designed and implemented command procedures that automated development workflows and improved coordination between source control systems and database environments.
- Supported the migration and implementation of financial control and reporting applications onto new computing platforms to improve system performance and reliability.
- Developed backend processing systems capable of handling large volumes of financial transaction records and distributing processed data to internal management information systems.
- Built data extraction and processing utilities that enabled the efficient transfer of financial transaction information between banking systems.

EDUCATION AND TRAINING

1987

Bachelor Of Science, Engineering
The Cooper Union, New York

1983

The Bronx High School Of Science

LANGUAGES

English:

C2

Proficient (C2)
